## Exercise: Import Data from a Formatted Excel File

You want to import the industry report (a formatted Excel file). To begin, start with a blank Excel file.

1. Import the data from the Excel file ("[Lab 6 – Industry Report.xlsx](#)") by creating a new Query. To do this, use the **From File / From Workbook** option.
2. Edit the query and perform the following steps:
  - Name the Query **IndustryReport**.
  - Remove the first and second rows of the table.
  - Promote the row that represents the title of the column to the table headers.
  - Fill the **Category** column with the correct categories.
  - Remove all the rows that represent total values.
  - Remove the remaining rows that do not represent data.
  - Remove the column that represent total values.
  - Remove the remaining columns that do not represent data.
  - Transform the monthly columns to rows and name the resulting columns appropriately. (Hint: You might find the Unpivot Columns feature useful).
  - Rename the resulting columns appropriately.
3. Load the data into Excel data model.

## Lab Question

4/4 points (graded)

Answer the following questions by reviewing the query you have just created.

How many rows were loaded into the data model?

436

✓

436

How many columns were left in the resulting table?

4

✓

4

Submit

You have used 1 of 2 attempts

✓ Correct (4/4 points)
